

HADOOP
IMPLEMENT THE MAX TEMPERATURE MAPREDUCE PROGRAM TO
IDENTIFY THE YEAR WISE MAXIMUM TEMPERATURE FROM
SENSORDATA

AIM

To implement the Max temperature MapReduce program to identify the year-wise maximum temperature from the sensor data.

Description

Sensors senses weather data in big text format containing station ID, year, date, time, temperature, quality etc. from each sensor and store it in a single line. Suppose thousands of data sensors are there, then we have thousands of records with no particular order. We require only a year and maximum temperature of particular quality in that year.

For example:

Input string from sensor:

002902907099999~~1902~~010720004+64333+023450

FM-12+

000599999V0202501N0278199999999N0000001N9-~~0033~~1+

99999098351ADDGF1029919999999999999999999

Here: ~~1902~~ is year

~~0033~~ is temperature

1 is measurement quality (Range between 0 or 1 or 4 or 5 or 9)

Here each mapper takes the input ~~key~~ as "byte offset of line" and ~~value~~ as "one weather sensor read i.e one line". and parse each line and produce an intermediate ~~key~~ "year" and ~~intermediate value~~ as "temperature of certain measurement qualities" for that year.

The combiner will form set values of temperature. Year and set of values of temperatures is given as input <key, value> to reducer and Reducer will produce year and maximum temperature for that year from the set of temperature values.

PROGRAM

RESULT

Thus a java program has been implemented to identify the year-wise maximum temperature from the sensor data.
